Ideation Phase – Empathize & Discover

Date	31 January 2025
Team ID	6ab8c2c230f9767f87730236
Project Name	Script-Controlled ACL – Restrict Record Access Based on Field Value
Maximum Marks	4 Marks

Empathy Map Canvas

User perspective: Employees, managers, and administrators who need secure access to records based on the value of a particular field.

THINK & FEEL	**SEE**
• Wants sensitive records to remain secure. • Feels concerned about unauthorized access. • Wants access rules to be automatic and reliable. • Values privacy, simplicity, and consistency.	• Different records with different field values. • Users with different roles or access levels. • Access-control rules and record-security settings. • Attempts to access restricted records.
HEAR	**SAY & DO**
• Hears security policies from administrators. • Receives instructions about who can access sensitive records. • Hears concerns about data leakage and unauthorized access.	• Requests only the records they are permitted to view. • Checks whether access is granted or denied correctly. • Reports incorrect access or permission problems. • Administrators configure and maintain access rules.
PAINS	**GAINS / NEEDS**
• Unauthorized users may see restricted records. • Manual permission management can be difficult. • Incorrect rules may block legitimate users. • Security mistakes can expose confidential information.	• Field-based access restrictions that work automatically. • Simple script-controlled ACL logic. • Correct access decisions for every record. • Better data confidentiality and easier administration.

User Goal: Ensure that users can access records only when the record's field value satisfies the defined access-control condition.

Key Problem Identified: Traditional or manually managed ACL rules may not dynamically restrict individual records according to changing field values.

Expected Solution Benefit: A script-controlled ACL evaluates the relevant field value at access time and allows or denies record access accordingly.
